Profile

With 3 years of experience in C++, I'm enthusiastic about writing and optimizing code related to machine learning and security.

EDUCATION

ETH Zürich SEMP student, M.Sc. Computer Science

• Thesis: Weakly Supervised Video Object Segmentation

• Activities: ETH Analytics Club

• Courses: Natural Language Processing, Advanced Machine Learning, Computer Vision Project

Chalmers University of Technology M.Sc. Data Science and AI

• **GPA**: 4.8/5.0

• Courses: Non-linear Optimization, Stochastic Processes and Bayesian Inference, Algorithms Computer Vision, Reinforcement Learning, Image Analysis, Large-scale Distributed Computation

Nanyang Technological University Exchange Student, B.Sc. Computer Science

• Courses: Digital Signal Processing, Cryptography, Operating Systems, Computer Networks

Luleå University of Technology B.Sc. Computer Science and Engineering

• **GPA**: 5.0/5.0

Gothenburg, Sweden

Zürich, Switzerland Sep 2022 - Sep 2023

Singapore

Luleå, Sweden

EXPERIENCE

Machine Learning Intern IBM Research

• Vision Transformer in PyTorch researching different types of normalization layers.

• Transformer KV-Cache. Multi-modal foundation models for drug discovery.

• Open source contributions to drug discovery project GT4SD and huggingface spaces.

Machine Learning Engineer Logiblox AG

• Increased token generation speed by over 300% on LLM inference server by implementing quantization, parallelization and deciding on the optimal hardware.

- Set up from scratch a dockerized server with CI/CD pipeline running llama.cpp for LLM inference.
- Optimized (caching and operation merging) compiler that converts visual no-code representation in to executable python code.
- Set up a database and code-sandbox for an user facing LLM app that clean datasets.

Master Thesis Student Computer Vision Lab ETH Zürich

• Supervised by Prof. Fisher Yu and Dr. Martin Danelljan. filipskogh.com/thesis.pdf

• Developed algorithm in PyTorch to calculate spatial and temporal information between video frames to derive self-supervised loss.

• Multi-GPU training on 8xA6000 node with DDP. Working with 100+ GB video datasets.

Optimization Research University of Massachusetts

• Our paper received the Best Paper Runner-up award at the 14th IEEE IGSC 2023 conference in Toronto, Canada.

- Mixed-integer optimization in a distributed systems setting.
- Developed a server load scheduler that route requests to data-centers such that carbon is minimized while satisfying latency constraint.

Security Software Engineer Orange Cyberdefense

- Developed threat response software in Python that block ransomware, C&C servers and take snapshots for forensics. Deployed globally on 50.000+ end points in 70+ countries.
- Offensive security: metasploit, kerberos security, email security.
- Network security, ssh and SMB server security, developed software to periodically scan network using nmap and masscan.

Aug 2021 - Sep 2023

Jan-Jun 2020

Aug 2018 - Jun 2021

Zürich, Switzerland May-Current 2024

Zürich, Switzerland

Oct 2023 - Apr 2024

Zürich, Switzerland Feb-Sep 2023

Massachusetts, United States Jun-Sep 2022

> Stockholm, Sweden Summers 2019 - 2021

Projects

Packet intercept proxy: C++ project developed continuously for three years by hooking Windows socket API send and recv using the Detours C++library. Large-scale reverse engineering of project with 100k+ loc. Reverse engineered encryption protocols and ciphers to intercept traffic at packet level.

Packet fuzzer: Wrote a custom fuzzer in C++ to search op-code ranges and packet payload data to find server-side exploits for an MMORPG game.

Teaching Transformers arithmetic: Trained a GPT-style Transformer in PyTorch to learn addition with different tokenizers. Showed that if the digits are tokenized in reverse order the problem is easier.

Neural network certification: Developed custom network layers in PyTorch to propagate intervals through a network allowing us to deterministically prove properties about robustness, certain fairness guarantees and that adversarial attacks are not possible. This project was part of the course Reliable and Trustworthy AI at ETH.

Blockchain implementation: Implemented parts of the Bitcoin protocol from scratch to create, (i) a wallet address derived

from an elliptic curve public key, (ii) a signed transaction which can be broadcasted to the network, and (iii) a block verifier.

Google Developer Student Club: Built an interactive 3D learning game in Unity3D C# by building a hospital simulator. The project idea was conceived by medical professors prompted by the pandemic and was aimed to simulate medical students' practicum. During the project I worked in close contact with medical professionals and translated medical procedures into implementable scenarios in-game.

RANSAC: Iterative parameter estimation using RANSAC with optimal hypothesis testing that minimizes the number of tests performed. The Project was motivated by the scarcity of available implementation and was based on the original white paper.

TECHNICAL SKILLS

Languages:

Python, C++, Java, C, Matlab, English, Swedish PyTorch, AFL++, Hugging Face, Map-Reduce, PySpark, OpenCV, Flask, Java Native Interface, MySQL Vim, Slurm, FastAPI, Docker, Git, Regex Frameworks:

Miscellaneous:
